was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              USA
                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA

                                                                                                     was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNDA2 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells
                                   purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pDM42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared adaptored mouse DNA was annealed to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Email: henkelg@aurorabio.com

pools of cells were isolated from a GenomeScreen(TM) library. The
library of cells was generated by retroviral integration of a gene
tagging element consisting of: 1) A promoterless beta-lactamase
proceeded by a splice acceptor as a reporter for gene expression;
2) A promoter driving neomycin resistance followed by a splice
donor to trap downstream exons. 3' RACE from neomycin gene was
performed using total RNA from isolated pools. Output was shotgun
cloned in pAmp-1 and used to transform DH5-alpha competent
bacteria. 5' ends of reported sequences were immediately preceded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     by splice donor from the trapping construct. Class: exon-trapped.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. 1 (bases 1 to 43) 1 (bases 1 rivanage.M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWA2 (gil4732114)gb|AFT290721), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114/gb)AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWN42 (gi14732114)gblAF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Organ: blood; Vector: pCRII; Site_1: EcoRI; Site_2:
EcoRI; Human peripheral blood mononuclear cells were
cultured in the presence or absence of erythropoietin.
CD71++++ cells arising only in erythropoietin-supplemented
medium were isolated by fluorescence activated cell
sorting. Those cells demonstrated an average of six
additional doublings in suspension culture and erythroid
colony formation in methylcellulose. Suppression
subtractive hybridization was used to construct the ad
library (tester=sorted CD71++++ cells, driver=unsorted
cells cultured without erythropoietin)."

to convert the signal sequence methionine codon into a NdeI site to allow cloning of the amplified genes into the vector without addition of vector-encoded amino acids. The C-terminal primers comprises the C-terminal 7 codons of each gene fused to the sequence CTCGAGCC, in order
                                                               E. coli verotoxin (VT) type 1 and 2 subunits A and B were cloned into pET-23b, designed to allow expression of the native proteins containing C-terminal polyhistidine tags. The VT-1 and VT-2 genes were engineered
                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preferably a fusion protein containing a non-VT protein sequence are part of the E.coli VTl or VT2 sequence. Two primers (AAT42655, AAT42656) were used to amplify the verotoxin VT-1 A subunit coding sequence and add a histidine tag coding sequence to the subunit sequence. Two primers (AAT42655, AAT42658) were used to amplify the verotoxin VT-1 A and B subunits and add a histidine tag coding verotoxin VT-1 A and B subunits and add a histidine tag coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compositions containing neutralising antitoxin against one or more E. coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhoeal disease or the development of extra-intestinal complications of E.coli infection,
                                                                                                                                  Example

The primers delete the native stop codons, and when cloned into pET-23 add a C-terminal extension of Leu-Glu-(His)6. WT B chains are small proteins (approximately 8 kDa), so use of a small affinity tag was preferred (i.e. polyhistidine). A polyhistidine affinity tag facilitates single step affinity purification of subunits from periplasmic extracts. However, due to poor recovery of his-tagged WT-1 A and WT-2 A chains, expression of maltose binding protein (MBP) fused subunits was undertaken. Due to the toxicity of the WT-2 B subunit, strict uninduced promoter control is necessary to permit cell viability. Bacterial host cells expressing a recombinant expression vector encoding a polyhistidine affinity tag and a portion of the WT-2 B chain are claimed. The vector is chosen from pET24V12B, where "L+" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature
                                                                                        This used
                                                                                                                                                                                                                                                                                                                                           14-SEP-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       form of the protein. The bacterial cell is capable of expressing large quantities (40 mg/l) of VT-2B. The toxins are useful for immunizing non-mammals and for detecting bacterial toxins in environmental samples

                                       sequence represents a PCR primer of the invention. The primer for amplification of the E. coli verotoxin (VT) gene. The onucleotide is useful for detection of inactivated VT gene by sfer of a foreign DNA fragment. Simple, rapid and specific ification of VT gene from environmental factors is achieved us

                                                                                                                                                                                                                        dysenteriae 1 delta-stxA allele. The delta-stxA allele was integrated into delta-guaB-A of delta-guaB-A, delta-virG S. dysenteriae 1, which inactivated the shiga toxin of this strain. The mutant can be used in the preparation of vaccines such as, a live vector vaccine comprising a Shigella mutant, (which encodes and expresses a foreign antigen, and a pharmaceutically acceptable carrier) or DNA mediated vaccine comprising the Shigella mutant (which also contains a plasmid which encodes and expresses a foreign antigen in a eukaryotic cell). The
                                                                                                                                                                                                                                                                                                                  This is a PCR primer used in the amplification of the Shigella dysenteriae 1 delta-stxA allele.                                                                                                                                                                                                                                                                                                                                                                                             previously unrecognised immunogenic cluster families. H. pylori antigens are used to detect H. pylori-specific antibodies, for diagnosing infection or to confirm eradication of infection, and in vaccines to protect against H. pylori infection and related diseases (gastritis, peptic ulcer, gastric adenocarcinoma/lymphoma). The present primer is used in the course of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful

        The sequences given in AAT39427-46 represent random oligonucleotides which were isolated due to their ability to bind to the human neuron-specific protein, Hel-N2. These sequences contain short stretches of uridylate residues interspersed with other residues. These Urich regions share homology with the 3'-UTR instability sequences.
                                                                                                          Prodn of cDNA library mRNA with RNA-binding

Hel-Nl cDNA was isolated by probing for rat and human elav counterparts using degenerate primers designed to simulate the RNP-l octamer sequence present in two of the three RNA recognition motifs (RRM's) of Drosophila elav. Hel-Nl was found to contain 3 RRM's, where the third one (see also AAW00244) is sufficient for mRNA 3'-UTR binding activity. Full length Hel-Nl, when transfected into a cell, causes cellular growth to cease, however, if just the third binding domain is transfected into cells, the cells undergo rapid growth. Hel-Nl binds as a multimer along the mRNA, presumably enhancing its localisation, instability and/or regulating it translatability and/or deadenylating it. This protein may be responsible for the growth cessation of neurons. Hel-Nl is an autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                which reside in the 3'-non-coding regions of mRNA's which encode oncoproteins and lymphokines. Hel-N2 is a deleted form of Hel-N1 in which the residues 239-251 have been deleted. This protein is expressed in medulloblastoma tumour cells and is not found in whole human brain. A small amount of Hel-N2 is also found in fetal brain,
                                                                   Use of proteins which bind RNA - for obtaining a cDNA library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC This represents a RNA sequence selected from a randomised RNA library CC by binding to human Hel-N2 under high stringency conditions. The CC invention provides a method for obtaining a cDNA library having members CC encoding a group of structurally or functionally related proteins from CC total cell mRNA. The method comprises binding RNA representing total cell mRNA to a protein that binds RNA and has specific binding to untranslated CC regions of a subset of the total cell mRNA, where the protein that binds CC RNA has been purified to remove any other protein that binds RNA. The CC resulting bound products are separated and a cDNA library is prepared. CC The protein that binds RNA may be Hel-N2, CArG, DT-7, K1, K2, CC K3, HuD, HuC, elav, rbp9, elf4B, sxl, tra-2, AUBF, AUF, ASF/SF2, UZAF, CC SC35, or hnRNP proteins. The cDNAs obtained can be used for chromosome CC mapping and genome sequencing of the structurally or functionally related CC genes encoding growth regulatory proteins. They can also be used in CC diagnostic methods for determining imbalances in such genes and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                         3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                        A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gene signature; messenger RNA; mRNA; relative abundance; frequency human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.

A specified application is targetting of RNA in the HIV-1 genome. When appropriately labelled it may also be used as a probe. Attachment of cleavage agents caused permanent inactivation of the target by site-specific cleavage.
                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                       Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT25576 standard; cDNA to mRNA; 48 BP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 30 BP; 12 A; 0 C; 5 G; 13 T; 0 other;

Residues II and I2 are linked via an o-xyloso group (i.e. nucleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Herpes Simplex virus I beginning at nucleotide 10996 and to covalently

```
New sequence-specific non-photo-activated crosslinking bind to the major groove of duplex DNA and are esp. use treating latent infections e.g. \rm HIV
This oligomer contains an inverted polarity region formed o-xyloso dimer synthon. Residues 11 and 12 are linked via \epsilon

the o-xylene ring). The sequence is designed to trarget the Herpes
Simplex virus I beginning at nucleotide 10996 and to covalently
cross-link to it. See also AAQ20151-Q20161.

                                                                                                                                                                              The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is a herpes simplex virus I duplex beginning at nucleotide 10996 contg. a purine-rich region concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnossis and therapy of diseases characterised by specific DNA duplex targets, e.g. respiratory syncytial virus, HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form
                                                                                                                                                                                                                                                                                                                                                                                                            17-APR-1991;

                                                                                                 contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the impositions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer state outlease activity. The oligomer is able to inhibit gene express
                                                                               to nuclease activity. The oligons verified by in vitro systems see also AAQ25452-25501 and AAQ
                                                                                                                                                            under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer

The linking gp. is o-xyloso (nucleotides have the 3' positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems.

The specific target sequence of this oligomer is a herpes simplex virus I duplex beginning at nucleotide 10996 contg. a purine-rich region concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. respiratory syncytial virus, HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer

The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylax: (e.g. to prevent or delay infection, inflammation, or tumor format: a research reagents (e.g. to distinguish between members of a biological pathway) and in kits. Sequences AAZ22150-189 represent phosphorothicate oligonucleotides used for antisense inhibition of cellular inhibitor of apoptosis-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic.
